

# Water Rhapsody Grand Opus Factsheet

**Water Rhapsody Grand Opus:** Rain falling from the roof into gutters is harvested at eave level, and put through a self-cleaning filter we call a Rain Runner. This is to run the water by gravity into an underground ring main, and collecting all downpipes into a single pipe surrounding the house. Our calculation of water tank size based on the roof area, the type of roof, and the number of people of household people drawing from the tanks is provided to ensure that the tanks fill but seldom overflow. Furthermore a comprehensive pumping system of water to the whole household is made taking into consideration the possibility (or likelihood) of water outages, and the ability to revert to a municipal supply when one cannot pump water is provided to all customers. Other features are an emergency supply of water provided for 48 hours of water in the event of a water outage as well as filtration to remove particulates balance the pH of rainwater and remove heavy metals and smell and taste from the water is provided with the system.
