

Other services Factsheet

Rain Sonata: not all homes are able to get water to run by gravity into water tanks. We have devised the Rain Sonata to automatically come to life to deliver rainwater to water tanks higher than the gutters at low pressure but very high delivery. This could be at a rate of say 120 litres per minute.

Ground water: over the past few years, through constant innovation we have developed ways to make most groundwater able to be used in the household. We have overcome issues like well buffered acid groundwater, high iron content as well as many dissolved minerals that need to be removed before pumping and using in the home.

Water Rhapsody Aria: The use of rainwater by pumping from a rainwater tank into the garden to spray with either a hand held hose or a Gardena type sprinkler. This pump system is the most inexpensive and silent way of pumping water from a rainwater tank.

Water Rhapsody Toccata: PV System: Photo Voltaic Systems are a wonderful means to deliver by pumping water without even going the route of converting the DC (Direct Current) into AC (Alternating Current). Should you be in a place without electricity or Eskom grow too unreliable and erratic one may still be able to pump water by producing one's own electricity.

Water Rhapsody Fugue: PV (Photo Voltaic) power for hot water cylinders. We have a whole range of system for heating hot water cylinders or combination of hot water cylinders. These range from two panel 60 volt DC system to as many as seven 250 watt panels. The main aim is to have the ability to provide hot water with the most power for the least cost and provide this power even in the event of cloud cover. The advantages are numerous in that the PV panels may be placed anywhere on the roof for best advantage of sun exposure and one needs only two wires from the panels to wherever the hot water cylinder is situated.

Rooftop Power Generation: Tango: Water Rhapsody is able to provide a rooftop generation system to provide an alternative power source in your home or business to ESKOM power and allow you to choose which source of power you would have to power your place. This includes PV panels, a voltage regulator / inverter unit and batteries which are connected to a new green plug wherever power is needed.

All devices to overcome obstacles are invented and given names by the Inventor Jeremy Westgarth-Taylor.
